# Introduction to Relational Algebra 

Elmasri/Navathe ch 6

Kjell Orsborn \&<br>Ruslan Fomkin<br>Department of Information Technology<br>Uppsala University, Uppsala, Sweden

## Query languages

- Languages where users can express what information to retrieve from the database.
- Categories of query languages:
- Procedural
- Non-procedural (declarative)
- Formal ("pure") languages:
- Relational algebra
- Relational calculus
- Tuple-relational calculus
- Domain-relational calculus
- Formal languages form underlying basis of query languages that people use.

## Relational algebra

- Relational algebra is a procedural langaue
- Operations in relational algebra takes one or two relations as arguments and return a new relation.
- Relational algebraic operations:
- Operations from set theory:
- Union, Intersection, Difference, Cartesian product
- Operations specifically introduced for the relational data model:
- Select, Project, Join
- It have been shown that the select, project, union, difference, and cartesian product operations form a complete set. That is any other relational algebra operation can be expressed in these.

## Operations from set theory

- Relations are required to be union compatible to be able to take part in the union, intersection and difference operations.
- Two relations $\mathrm{R}_{1}$ and $\mathrm{R}_{2}$ is said to be union-compatible if:
$\mathrm{R}_{1} \subseteq \mathrm{D}_{1} \times \mathrm{D}_{2} \times \ldots \times \mathrm{D}_{\mathrm{n}}$ and $\mathrm{R}_{2} \subseteq \mathrm{D}_{1} \times \mathrm{D}_{2} \times \ldots \times \mathrm{D}_{\mathrm{n}}$
i.e. if they have the same degree and the same domains.

## Union operation

- The union of two union-compatible relations $R$ and $S$ is the set of all tuples that either occur in $R, S$, or in both.
- Notation: $\mathrm{R} \cup \mathrm{S}$
- Defined as: $R \cup S=\{t \mid t \in R$ or $t \in S\}$
- For example:

| $A$ | $B$ |
| :---: | :---: |
| a | 1 |
| a |  |
| b |  |
| b |  |

| $A$ | $B$ |
| :---: | :---: |
| a | 2 |
| b | 3 |$=$| $A$ | $B$ |
| :--- | :--- |
| a | 1 |
| a | 2 |
| b | 1 |
| b | 3 |

## Difference operation

- The difference between two union-compatible sets $R$ and $S$ is the set of all tuples that occur in $R$ but not in $S$.
- Notation: R - S
- Defined as: $R-S=\{t \mid t \in R$ and $t \notin S\}$
- For example:

| $A$ | $B$ |
| :---: | :---: |
| a | 1 |
| a | 2 |
| b | 1 |$-$| $A$ | $B$ |
| :--- | :--- |
| a | 2 |
| b | 3 |$=$| $A$ | $B$ |
| :---: | :---: |
| a | 1 |
| b | 1 |

## Intersection

- The intersection of two union-compatible sets $R$ and $S$, is the set of all tuples that occur in both $R$ and $S$.
- Notation: $\mathrm{R} \cap \mathrm{S}$
- Defined as: $R \cap S=\{t \mid t \in R$ and $t \in S\}$
- For example:

| $A$ | $B$ |
| :---: | :---: |
| a | 1 |
| a | 2 |
| b | 1 |

| $A$ | $B$ |
| :---: | :---: |
| a | 2 |
| b | 3 |

| $A$ | $B$ |
| :---: | :---: |
| a | 2 |

## Cartesian product

- Let R and S be relations with k 1 and k 2 arities resp. The cartesian product of $R$ and $S$ is the set of all possible $\mathrm{k}_{1}+\mathrm{k}_{2}$ tuples where the first $\mathrm{k}_{1}$ components constitute a tuple in $R$ and the last $\mathrm{k}_{2}$ components a tuple in $S$.
- Notation: $\mathrm{R} \times \mathrm{S}$
- Defined as: $\mathrm{R} \times \mathrm{S}=\{\mathrm{tq} \mid \mathrm{t} \in \mathrm{R}$ and $\mathrm{q} \in \mathrm{S}\}$
- Assume that attributes of $\mathrm{r}(\mathrm{R})$ and $\mathrm{s}(\mathrm{S})$ are disjoint (i.e. $\mathrm{R} \cap \mathrm{S}=\perp$ ). If attributes of $r(R)$ and $s(S)$ are not disjoint, then renaming must be used.

## Cartesian product example

| $A$ | $B$ |
| :--- | :--- |
| a | 1 |
| b | 2 | C | C | $D$ |
| :--- | :--- |
| a | 5 |
| b | 5 |
| b | 6 |
| c | 5 |$|$| $A$ | $B$ | C | $D$ |
| :--- | :--- | :--- | :--- |
| a | 1 | a | 5 |
| a | 1 | b | 5 |
| a | 1 | b | 6 |
| a | 1 | c | 5 |
| b | 2 | a | 5 |
| b | 2 | b | 5 |
| b | 2 | b | 6 |
| b | 2 | c | 5 |

## Selection operation

- The selection operator, $\sigma$, selects a specific set of tuples from a relation according to a selection condition (or selection predicate) $P$.
- Notation: $\sigma_{p}(\mathrm{R})$
- Defined as: $\sigma_{p}(\mathrm{R})=\{\mathrm{t} \mid \mathrm{t} \in \mathrm{R}$ AND $P(\mathrm{t})\}$ (i.e. the set of tuples t in $R$ that fulfills the condition $P$ )
- Where $P$ is a logical expression ${ }^{(*)}$ consisting of terms connected by:
$\wedge($ and $), \vee($ or $), ~ \neg($ not $)$ and each term is one of:
<attribute> op <attribute> or <constant> where $o p$ is one from the set $\{=,<, \leq, \geq,>, \neq\}$

Example: $\sigma_{\text {SALARY }>30000}$ (EMPLOYEE)
$(*)$ a formula in propositional calculus

## Selection example

$$
\mathrm{R}=\begin{array}{|l|l|l|l|}
\hline A & B & \mathrm{C} & D \\
\hline \mathrm{a} & \mathrm{a} & 1 & 7 \\
\mathrm{a} & \mathrm{~b} & 5 & 7 \\
\mathrm{~b} & \mathrm{~b} & 2 & 3 \\
\mathrm{~b} & \mathrm{~b} & 4 & 9 \\
\hline
\end{array}
$$

$$
\sigma_{A=B, D>5}(\mathrm{R})
$$

$$
=\begin{array}{|c|c|c|c|}
\hline A & B & C & D \\
\hline \mathrm{a} & \mathrm{a} & 1 & 7 \\
\mathrm{~b} & \mathrm{~b} & 4 & 9 \\
\hline
\end{array}
$$

## Projection operation

- The projection operator, $\pi$, picks out (or projects) listed columns from a relation and creates a new relation consisting of these columns.
- Notation: $\pi_{A_{1}, A_{2}, \ldots, A_{k}}(R)$ where $A_{1}, A_{2}$ are attribute names and R is a relation name.
- The result is a new relation of k columns.
- Duplicate rows removed from result, since relations are sets.

Example: $\pi_{\text {LNAME,FNAME,SALARY }}(E M P L O Y E E)$

## Projection example

$$
\mathrm{R}=\begin{array}{|l|l|l|}
\hline A & B & C \\
\hline \mathrm{a} & 1 & 1 \\
\mathrm{a} & 2 & 1 \\
\mathrm{~b} & 3 & 1 \\
\mathrm{~b} & 4 & 2 \\
\hline
\end{array}
$$

$$
\pi_{A, C}(\mathrm{R})=\begin{array}{|l|l|}
\hline A & C \\
\hline \mathrm{a} & 1 \\
\mathrm{~b} & 1 \\
\mathrm{~b} & 2 \\
\hline
\end{array}
$$

## Join operator <br> $凶$

- The join operator creates a new relation by joining related tuples from two relations.
- Notation: $R \bowtie_{C} S$
$C$ is the join condition which has the form $A_{r} \Theta A_{S}$, where $\Theta$ is one of $\{=,<,>, \leq, \geq, \neq\}$. Several terms can be connected as $C_{1}$ $\wedge C_{2} \wedge \ldots C_{k}$
- A join operation with this kind of general join condition is called "Theta join".

## Example Theta join

| R |  |  | S |  |  |  | $R \bowtie_{A \leq D} \mathrm{~S}$ |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A | B | C | $\bigotimes_{A \leq D}$ | $B$ | C | D | $=$ | A | B | C | $B$ | C | D |
| 1 | 2 | 3 |  | 2 | 3 | 4 |  | 1 | 2 | 3 | 2 | 3 | 4 |
| 6 | 7 | 8 |  | 7 | 3 | 5 |  | 1 | 2 | 3 | 7 | 3 | 5 |
| 9 | 7 | 8 |  | 7 | 8 | 9 |  | 1 | 2 | 3 | 7 | 8 | 9 |
|  |  |  |  |  |  |  |  | 6 | 7 | 8 | 7 | 8 | 9 |
|  |  |  |  |  |  |  |  | 9 | 7 | 8 | 7 | 8 | 9 |

$\qquad$ -

## Equijoin

- The same as join but it is required that attribute $A_{r}$ and attribute $A_{s}$ should have the same value.
- Notation: $R \bowtie_{C} S$
$C$ is the join condition which has the form $A_{r}=A_{s}$. Several terms can be connected as $C_{1} \wedge C_{2} \wedge \ldots C_{k}$.

## Example Equijoin

| R |  | S |  |  |  |  | $\mathrm{R} \bowtie_{B=C} \mathrm{~S}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A | $B$ | $凶{ }_{B=C}$ | C | D | $E$ | $=$ | A | B | C | D | $E$ |
| a | 2 |  | 2 | d | e |  | a | 2 | 2 | d | e |
| a | 4 |  | 4 9 | d | e |  | a | 4 | 4 | d | e |

$\qquad$

## Natural join

- Natural join is equivalent with the application of join to R and S with the equality condition $A_{r}=A_{s}$ (i.e. an equijoin) and then removing the redundant column $A_{s}$ in the result.
- Notation: R * ${ }_{A r, A s} S$
$A_{r}, A_{s}$ are attribute pairs that should fulfil the join condition which has the form $A_{r}=A_{s}$. Several terms can be connected as $C_{1} \wedge C_{2} \wedge \ldots C_{k}$.

## Example Natural join

| R |  | S |  |  |  | $\mathrm{R}{ }^{\text {B }, \mathrm{C}} \mathrm{S}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A | B | * ${ }_{\text {C }}$ | C | D | E | $=$ | A | B | D | E |
| a | 2 |  | 2 | d | e |  | a | 2 | d | e |
| a | 4 |  | 4 | d | e |  | a | 4 | d | e |

## Composition of operations

- Expressions can be built by composing multiple operations
- Example: $\sigma_{A=C}(\mathrm{R} \times \mathrm{S})$

| $\mathrm{R} \times \mathrm{S}$ | A | B | X | C |  |  | $=$ | A | B | c |  | D |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 |  | a |  |  |  | a | 1 |  |  |  |
|  | b | 2 |  | b |  |  |  | a | 1 | b |  | 5 |
|  |  |  |  | b |  |  |  | a | 1 |  |  | 6 |
|  |  |  |  | c |  |  |  | a | 1 |  |  | 5 |
|  |  |  |  |  |  |  |  | b | 2 |  |  | 5 |
|  |  |  |  |  |  |  |  | b | 2 |  |  | 5 |
| $\sigma_{A=C}(\mathrm{R} \times \mathrm{S})$ |  | A | B |  | D |  |  | b | 2 |  |  | 6 5 |
|  |  | a | 1 |  |  |  |  | b |  |  |  |  |
|  |  | b | 2 |  | 5 |  |  |  |  |  |  |  |
|  |  | b | 2 | b |  |  |  |  |  |  |  |  |

## Assignment operation

- The assignment operation (P) makes it possible to assign the result of an expression to a temporary relation variable.
- Example: temp $\mathrm{P} \quad \sigma_{d n o=5}(E M P L O Y E E)$
result $\mathrm{P} \pi_{\text {fname,lname,salary }}$ (temp)
- The result to the right of the P is assigned to the relation variable on the left of the $P$.
- The variable may use variable in subsequent expressions.

## Renaming relations and attribute

- The assignment operation can also be used to rename relations and attributes.
- Example: NEWEMP P $\sigma_{\mathrm{dno}=5}($ EMPLOYEE)
$\rho_{\text {(FIRSTNAME,LASTNAME,SALARY) }} \pi_{\text {fname,Iname,salary }}$ (NEWEMP)

## Division operation

- Suited to queries that include the phrase "for all".
- Let $R$ and $S$ be relations on schemas $R$ and $S$ respectively, where $R=\left(A_{1}, \ldots, A_{m}, B_{1}, \ldots, B_{n}\right)$

$$
s=\left(B_{1}, \ldots, B_{n}\right)
$$

- The result of $\mathrm{R} \div \mathrm{S}$ is a relation on schema
$R-S=\left(A_{1}, \ldots, A_{m}\right)$
$R \div S=\left\{\mathrm{t} \mid \mathrm{t} \in \pi_{R-S}(R) \forall \mathrm{u} \in S \wedge \mathrm{tu} \in R\right\}$

## Example Division operation

## Relation algebra as a query language

- Relational schema: supplies(sname, iname, price)
- "What is the names of the suppliers that supply cheese?" $\pi_{\text {sname }}\left(\sigma_{\text {iname='CHEESE }}(S U P P L I E S)\right)$
- "What is the name and price of the items that cost less than $5 \$$ and that are supplied by WALMART"
$\pi_{\text {iname, price }}\left(\sigma_{\text {sname }}=\right.$ 'WALMART'^ price < 5 (SUPPLIES))
