Overview

Tensors: Vectors, matrices and so on ...

- Definitions
- Operations
- Classical Decompositions:
 - PARAFAC/Candecomp = polyadic = CP
 - Tucker, HOSVD

Different Matrix/Vector Products

Kronecker product

Vector case (row or column form):

$$\begin{aligned} a \otimes b &= (a_1 \quad \cdots \quad a_n) \otimes (b_1 \quad \cdots \quad b_m) = \\ &= (a_1 b \quad \cdots \quad a_n b) = (a_1 b_1 \quad \cdots \quad a_1 b_m \quad \cdots \quad a_n b_1 \quad \cdots \quad a_n b_m) \end{aligned}$$

$$\begin{aligned} a \otimes b &= (a_1 \quad \cdots \quad a_n) \otimes \begin{pmatrix} b_1 \\ \vdots \\ b_m \end{pmatrix} = \\ &= (a_1 b \quad \cdots \quad a_n b) = \begin{pmatrix} a_1 b_1 & \cdots & a_n b_1 \\ \vdots & & \vdots \\ a_1 b_m & \cdots & a_n b_m \end{pmatrix} \end{aligned}$$

Kronecker Product

Matrix case:

$$A := (a_{ij})_{i,j=1}^{m,n} = (a_1 \quad \cdots \quad a_n), \quad B := (b_{ij})_{i,j=1}^{r,s} = (b_1 \quad \cdots \quad b_s)$$

$$A \otimes B = \begin{pmatrix} a_{11}B & a_{12}B & \cdots & a_{1n}B \\ a_{21}B & a_{22}B & \cdots & a_{2n}B \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1}B & a_{m2}B & \cdots & a_{mn}B \end{pmatrix} =$$

$$= (a_1 \otimes b_1 \quad a_1 \otimes b_2 \quad a_1 \otimes b_3 \quad \cdots \quad a_n \otimes b_{s-1} \quad a_n \otimes b_s)$$

$$A = \begin{pmatrix} 1 & 3 \\ 2 & 4 \end{pmatrix}, \quad B = \begin{pmatrix} 5 & 7 \\ 6 & 8 \end{pmatrix}, \Rightarrow A \otimes B = \begin{pmatrix} 5 & 7 & | & 15 & 21 \\ 6 & 8 & | & 18 & 24 \\ \hline 10 & 14 & | & 20 & 28 \\ 12 & 16 & | & 24 & 32 \end{pmatrix}$$

Khatri-Rao Product

$$A = (a_1 \quad \cdots \quad a_n), \quad B = (b_1 \quad \cdots \quad b_n);$$

$$A \bullet B = (a_1 \otimes b_1 \quad a_2 \otimes b_2 \quad a_3 \otimes b_3 \quad \cdots \quad a_{n-1} \otimes b_{n-1} \quad a_n \otimes b_n)$$

= matching columnwise Kronecker product

only for matrices with the same number of columns!

$$A = \left(\begin{array}{c|c} 1 & 3 \\ \hline 2 & 4 \end{array} \right) \quad B = \left(\begin{array}{c|c} 5 & 7 \\ \hline 6 & 8 \end{array} \right), \Rightarrow A \bullet B = \left(\begin{array}{c|c} 5 & 21 \\ \hline 6 & 24 \\ \hline 10 & 28 \\ \hline 12 & 32 \end{array} \right)$$

Hadamard Product

$$A = \begin{pmatrix} a_{11} & \cdots & a_{1n} \\ \vdots & & \vdots \\ a_{m1} & \cdots & a_{mn} \end{pmatrix} \quad B = \begin{pmatrix} b_{11} & \cdots & b_{1n} \\ \vdots & & \vdots \\ b_{m1} & \cdots & b_{mn} \end{pmatrix}$$

$$A * B = \begin{pmatrix} a_{11}b_{11} & a_{12}b_{12} & \cdots & a_{1n}b_{1n} \\ a_{21}b_{21} & a_{22}b_{22} & \cdots & a_{2n}b_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1}b_{m1} & a_{m2}b_{m2} & \cdots & a_{mn}b_{nm} \end{pmatrix}$$

only for matrices of equal size!

Minitask 0

$$a = \begin{pmatrix} 1 \\ 1 \end{pmatrix}, b = (1 \quad -1)$$

$$A := a \cdot b = ?$$

$$A \cdot a = ?$$

$$b \cdot A = ?$$

$$a^T \cdot b^T = ?$$

$$a \otimes b = ?$$

$$a \otimes b^T = ?$$

$$a^T \bullet b = ?$$

$$a \bullet b^T = ?$$

$$a^T * b = ?$$

$$a = \begin{pmatrix} 1 \\ 1 \end{pmatrix}, b = (1 \quad -1)$$

$$A := a \cdot b = \begin{pmatrix} 1 & -1 \\ 1 & -1 \end{pmatrix}$$

$$A \cdot a = (0 \quad 0)^T$$

$$b \cdot A = (0 \quad 0)$$

$$a^T \cdot b^T = 0$$

$$a \otimes b = \begin{pmatrix} 1 & -1 \\ 1 & -1 \end{pmatrix}$$

$$a \otimes b^T = (1 \quad -1 \quad 1 \quad -1)^T$$

$$a^T \bullet b = (1 \quad -1)$$

$$a \bullet b^T = (1 \quad -1 \quad 1 \quad -1)^T$$

$$a^T * b = (1 \quad -1)$$

Definition

Tensor as multi-indexed object:

One index: vector:

$$x = (x_i)_{i=1}^n = (x_{i_1})_{i_1=1}^n = \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix} \quad \text{or} \quad x = (x_1 \quad \cdots \quad x_n)$$

Two indices: matrix:

$$A = (A_{i,j})_{i=1,j=1}^{n,m} = (A_{i_1,i_2})_{i_1=1,i_2=1}^{n_1,n_2} = \begin{pmatrix} a_{1,1} & \cdots & a_{1,m} \\ \vdots & \ddots & \vdots \\ a_{n,1} & \cdots & a_{n,m} \end{pmatrix}$$

⋮

Three indices: cube:

$$A = (A_{i,j,k})_{i=1,j=1,k=1}^{n,m,l} = (A_{i_1,i_2,i_3})_{i_1=1,i_2=1,i_3=1}^{n_1,n_2,n_3}$$

$a_{1,1,1}$
 \downarrow
 $a_{2,1,1}$
 \vdots

\nearrow
 \rightarrow

$a_{1,1,2}$
 $a_{1,2,1} \quad \cdots$

Multi-index:

$$x = (x_{i_1 i_2 \dots i_N})_{i_1=1, i_2=1, \dots, i_N=1}^{n_1, n_2, \dots, n_N}$$

Motivation: Why tensors?

PDE for two-dimensional problems:

$$(au_x)_x + (bu_y)_y = f(x, y)$$

Discretization in 2D:
$$\frac{au_{i-1,j} + au_{i+1,j} - (a+b)u_{i,j} + bu_{i,j-1} + bu_{i,j+1}}{h^2} = f_{i,j}$$

$u_{i,j}$ can be seen as a vector or as a 2-way tensor = matrix.

Linear system $Au=f$ with block matrix A :

$$A_{ij,km} u_{km} = f_{ij}$$

So matrix $A_{ij,km}$ can be also seen as a 4-way tensor

Motivation: Why tensors?

PDE with a number of unknown additional parameters,
high-dimensional problems:

$$au_{xx} + bu_{yy} + cu_{zz} = f \quad \text{for discrete sets of parameters } a_i, b_j, c_k$$

Leads to linear system $A_{ijk}x_{ijk} = f_{ijk}$ for each i, j, k

Classical matrix/vector problems but for huge problems:
Represent vector/matrix by tensor with efficient representation.
Reshape:

$$x_i = x_{i_1 \dots i_N}$$

Examples for Reshape

Storing matrix: dense (column or row oriented)
sparse format

Frobenius norm of a matrix: $\|A\|_F^2 = \sum_{i,j} |a_{ij}|^2 = \|\text{vec}(A)\|_2^2$

Matrix equation: Sylvester $AX + XB = C$

$$(I \otimes A + B^T \otimes I) \text{vec}(X) = \text{vec}(C)$$

$$u_{xx} + u_{yy} = f \rightarrow A_{ij,rs} \leftrightarrow A_{n,m}$$

Discretization x_i and y_j leads to linear system in $A_{ij,rs}$

Minitask 1

Write vector $x = (1, 2, \dots, 8)$ as 3D cube by reshaping:

$$i = 4 \cdot i_3 + 2 \cdot i_2 + i_1, \quad i_j \in \{0, 1\}$$

$$x_i = x_{i_3 i_2 i_1} = ?$$

Value:	1	2	3	4	5	6	7	8
Index:	0	1	2	3	4	5	6	7
Binary:	000	001	010	011	100	101	110	111

Graphical Notation

Graphical Notation

Matrix-vector product – contraction over index i :

$$\left(a_{ij}\right)_{i,j} \cdot \left(x_i\right)_i = \left(y_j\right)_j \quad \Leftrightarrow \quad \begin{array}{c} \boxed{} \\ | \end{array} \overset{i}{\text{---}} \boxed{} \quad \Leftrightarrow \quad \begin{array}{c} \boxed{} \\ | \end{array}$$

$$\sum_i a_{ij} x_i = a_{ij} x_i = y_j$$

Einstein notation,
 shared indices are contracted via summation.
 No distinction between covariant and contravariant!

Basic Operations

Contraction

$$\sum_{i_1} x_{i_1} y_{i_1} \text{ gives scalar}$$

z

Tensor product

$$x_{i_1} y_{i_2} \text{ gives 2-tensor}$$

$z_{i_1 i_2}$

More general:

$$\sum_{i_n} x_{i_1 \dots i_n \dots i_N} y_{i'_1 \dots i'_{n-1} i_n i'_{n+1} \dots i'_M} = z_{i_1 \dots i_{n-1} i_{n+1} \dots i_N i'_1 \dots i'_{n-1} i'_{n+1} \dots i'_M}$$

Tensor as data hive of different form

$$\mathit{kron}(x, y) = x \otimes y = (x_1 y \quad \cdots \quad x_n y)^T = (x_{i_1} y_{i_2})_{i_1, i_2} \quad \text{seen as a column vector}$$

$$xy^T = \begin{pmatrix} x_1 y_1 & \cdots & x_1 y_m \\ \vdots & \ddots & \vdots \\ x_n y_1 & \cdots & x_n y_m \end{pmatrix} = (x_{i_1} y_{i_2})_{i_1, i_2} \quad \text{seen as a matrix}$$

$$= \mathit{kron}(y^T, x) = y^T \otimes x$$

$$yx^T = \begin{pmatrix} y_1 x_1 & \cdots & y_1 x_n \\ \vdots & \ddots & \vdots \\ y_m x_1 & \cdots & y_m x_n \end{pmatrix} = (x_{i_1} y_{i_2})_{i_1, i_2} \quad \text{seen as a matrix}$$

$$= \mathit{kron}(x^T, y) = x^T \otimes y$$

$$x \circ y = (x_{i_1} y_{i_2})_{i_1, i_2} \quad \text{seen as a two-leg tensor}$$

Matrix

Operations: Contractions

$$\sum_{i_1} A_{i_1 i_2} x_{i_1} = z_{i_2}$$

$$\sum_{i_2} A_{i_1 i_2} y_{i_2} = z_{i_1}$$

$$\sum_{i_1 i_2} A_{i_1 i_2} x_{i_1} y_{i_2} = z$$

$$\sum_{i_2} A_{i_1 i_2} B_{i_2 i_3} = C_{i_1 i_3}$$

Tensor product:

$$A_{i_1 i_2} x_{i_3} = C_{i_1 i_2 i_3}$$

Three Leg as Standard example

Operations: Contractions in i_1 , i_2 , i_3 or combinations gives tensor with less legs.

Tensor product gives tensor with more legs.

See tensor as - collection of vectors \mathfrak{g} fiber

- collection of matrices \mathfrak{g} slices

- large matrix, unfolding

$$A_{\{i_1 i_2\} i_3} = A_{j_1 i_3}$$

Operations between tensors are defined by contracted indices.

Fibers

A: 3 x 4 x 2 – tensor

	13	16	19	22
1	4	7	10	
2	14	17	20	23
3	15	18	21	24
	6	9	12	

Mode-1 fibers, $X_{:,j,k}$:

1	4	7	10	13	16	19	22
2	5	8	11	14	17	20	23
3	6	9	12	15	18	21	24

Mode-2 fibers, $X_{j,:,k}$:

1	2	3	13	14	15
4	5	6	16	17	18
7	8	9	19	20	21
10	11	12	22	23	24

Mode-3 fibers, $X_{j,k,:}$:

1	2	3	4	5	6	7	8	9	10	11	12
13	14	15	16	17	18	19	20	21	22	23	24

Slices

A: 3 x 4 x 2 – tensor

Frontal slices, 1,2: X[:, :, k]

1	4	7	10	13	16	19	22
2	5	8	11	14	17	20	23
3	6	9	12	15	18	21	24

Lateral slices, 1,3: X[:, k, :]

1	13	4	16	7	19	10	22
2	14	5	17	8	20	11	23
3	15	6	18	9	21	12	24

Horizontal sl. 2,3: X[k, :, :]

13	16	19	22	14	17	20	23	15	18	21	24
1	4	7	10	2	5	8	11	3	6	9	12

Matricification

A: 3 x 4 x 2 – tensor

	13	16	19	22
1	4	7	10	
	14	17	20	23
2	5	8	11	
	15	18	21	24
3	6	9	12	

Mode-1 unfolding:

$$A_{(1)} = \left(\begin{array}{c|cccc} 1 & 4 & 7 & 10 & 13 & 16 & 19 & 22 \\ 2 & 5 & 8 & 11 & 14 & 17 & 20 & 23 \\ 3 & 6 & 9 & 12 & 15 & 18 & 21 & 24 \end{array} \right)$$

$$A_{i_1\{i_2i_3\}} = A_{i_1j_1}$$

$$j_1 = i_2 + n_2(i_3 - 1)$$

Mode-2 unfolding

$$A_{(2)} = \left(\begin{array}{cccccc} 1 & 2 & 3 & 13 & 14 & 15 \\ 4 & 5 & 6 & 16 & 17 & 18 \\ 7 & 8 & 9 & 19 & 20 & 21 \\ 10 & 11 & 12 & 22 & 23 & 24 \end{array} \right)$$

$$A_{i_2\{i_1i_3\}}$$

Mode-3 unfolding

$$A_{(3)} = \left(\begin{array}{cccccccccccc} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 \\ 13 & 14 & 15 & 16 & 17 & 18 & 19 & 20 & 21 & 22 & 23 & 24 \end{array} \right)$$

Vectorization:

$$\text{vec}(A) = (1 \ 2 \ \dots \ 23 \ 24)^T$$

General Matricification

Tensor $A_{i_1 \dots i_n i_{n+1} \dots i_N} \rightarrow A_{\{i_1 \dots i_n\} \{i_{n+1} \dots i_N\}} = A_{ij}$ Matrix

$$i = i_1 + n_2(i_2 - 1) + n_2 n_3(i_3 - 1) + \dots + n_2 \cdots n_n(i_n - 1),$$

$$j = i_{n+1} + n_{n+2}(i_{n+2} - 1) + n_{n+2} n_{n+3}(i_{n+3} - 1) + \dots + n_{n+2} \cdots n_N(i_N - 1).$$

or with any partitioning of the indices in two groups
(rows/columns) ($\{i_1 i_3 \dots\} \{i_2 i_4 \dots\}$ or $\{i_{\pi(1)} \dots i_{\pi(n)}\} \{i_{\pi(n+1)} \dots i_{\pi(N)}\}$)

Minitask 2: Write mode-1 matricification of the tensor of task 1.

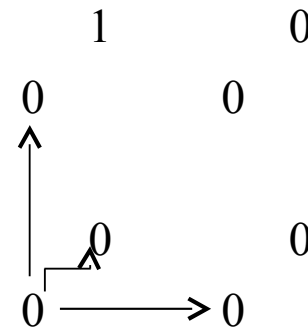

1 3 5 7
2 4 6 8

General remark on notation:
many properties/operations with tensors are formulated
using totally different notations! $\blacktriangleright, \blacktriangleleft, \odot,$

Basis Transformation

Tensor

$$A = \sum_{i=1}^I \sum_{j=1}^J \sum_{k=1}^K A_{ijk} e_i^{(1)} \otimes e_j^{(2)} \otimes e_k^{(3)}$$

Change of basis

$$e_i^{(l)} = Q^{(l)} e_i'^{(l)}$$

$$A'_{pqr} = \left(\sum_i \sum_j \sum_k A_{ijk} Q^{(1)} e_i'^{(1)} \otimes Q^{(2)} e_j'^{(2)} \otimes Q^{(3)} e_k'^{(3)} \right)_{pqr} =$$

$$= \sum_{i=1}^I \sum_{j=1}^J \sum_{k=1}^K Q_{pi}^{(1)} Q_{qj}^{(2)} Q_{rk}^{(3)} A_{ijk}$$

Notation:

$$A' = \left(Q^{(1)}, Q^{(2)}, Q^{(3)} \right) \cdot A$$

n-Mode Product of Tensor with Matrix

Tensor Matrix

$$A_{i_1 \dots i_n \dots i_N}, \quad U_{j i_n} : (A \times_n U)_{i_1 \dots i_{n-1} j i_{n+1} \dots i_N} = \sum_{i_n=1}^{I_n} a_{i_1 \dots i_N} \cdot u_{j i_n} =: B_{i_1 \dots j \dots i_N}$$

Contraction over i_n , i_n is replaced by index $j := i_n$

In the n-mode product each mode-n fiber is multiplied by the matrix U:

$$B_{i_1 \dots i_{n-1}, j, i_{n+1} \dots i_N} = U \cdot A_{i_1 \dots i_{n-1}, i_n, i_{n+1} \dots i_N}$$

Useful relation between n-mode product and mode-n-unfolding:

$$B_{(n)} = U \cdot A_{(n)}$$

Unfold tensor A to matrix, multiply by U, fold back to tensor B.

n-Mode Products

For multiple n-mode product the order is irrelevant:

$$n \neq m : A \times_m U \times_n V = A \times_n V \times_m U$$

$$\begin{aligned} & \sum_{i_m} \left(\sum_{i_n} A_{i_1 \dots i_n \dots i_m \dots i_N} U_{ji_n} \right) V_{ki_m} = \\ &= \sum_{i_n i_m} A_{i_1 \dots i_n \dots i_m \dots i_N} U_{ji_n} V_{ki_m} = \sum_{i_m i_n} A_{i_1 \dots i_n \dots i_m \dots i_N} V_{ki_m} U_{ji_n} = \\ &= \sum_{i_n} \left(\sum_{i_m} A_{i_1 \dots i_n \dots i_m \dots i_N} V_{ki_m} \right) U_{ji_n} \end{aligned}$$

A matrix:

$$B = A \times_1 U \times_2 V \Leftrightarrow$$

$$(B_{jk}) = (A_{i_1 i_2}) \times_1 (U_{j i_1}) \times_2 (V_{k i_2}) = U \cdot A \cdot V^T = U_{j,:} \cdot A \cdot (V_{k,:})^T$$

especially

$$A \times_1 U = U \cdot A, \quad A \times_2 V = A \cdot V^T$$

n-Mode Products

For multiple n-mode product with the same n
the order is relevant:

$$A \times_n U \times_n V = A \times_n (VU)$$

$$\begin{aligned} & \sum_{i'_n} \left(\sum_{i_n} A_{i_1 \dots i_n \dots i_N} U_{i'_n i_n} \right) V_{ki'_n} = \\ &= \sum_{i_n} A_{i_1 \dots i_n \dots i_N} \sum_{i'_n} U_{i'_n i_n} V_{ki'_n} = \sum_{i_n} A_{i_1 \dots i_n \dots i_N} \sum_{i'_n} V_{ki'_n} U_{i'_n i_n} = \\ &= \sum_{i_n} A_{i_1 \dots i_n \dots i_N} W_{ki_n} = B_{i_1 \dots k \dots i_N} \end{aligned}$$

Matrix case:

$$A \times_1 U \times_1 V = V \cdot U \cdot A = (VU) \cdot A,$$

$$A \times_2 U \times_2 V = A \cdot U^T \cdot V^T = A \cdot (VU)^T$$

Full n-mode Product

1-leg tensor a :
$$\text{vec}(a \times_1 U) = \text{vec}(Ua) = U \cdot \text{vec}(a)$$

2-leg tensor A :
$$\begin{aligned} \text{vec}(A \times_1 U \times_2 V) &= \text{vec}\left(\sum A_{i_1 i_2} U_{i_1 k_1} V_{i_2 k_2}\right) = \\ &= \left(\sum A_{i_1 i_2} U_{i_1 k_1} V_{i_2 k_2}\right)_{k_1 k_2} = (V \otimes U) \cdot \text{vec}(A) \end{aligned}$$

n-leg tensor A :

$$\text{vec}(A \times_1 U_1 \times_2 \dots \times_N U_N) = (U_N \otimes \dots \otimes U_1) \cdot \text{vec}(A)$$

n-Mode Product with vector

n-mode vector product of tensor A with vector v:
Compute all inner products of mode-n fibers with v.

$$A \bar{\times}_n v = \left(\sum_{i_n=1}^{n_n} A_{i_1 \dots i_n \dots i_N} v_{i_n} \right)_{i_1 \dots i_{n-1} i_{n+1} \dots i_N}$$

$$\begin{aligned} A \bar{\times}_n v \bar{\times}_m u &= (A \bar{\times}_n v) \bar{\times}_{m-1} u = (A \bar{\times}_m u) \bar{\times}_n v = \\ &= \left(\sum_{i_n=1}^{n_n} \sum_{i_m=1}^{n_m} A_{i_1 \dots i_n \dots i_m \dots i_N} v_{i_n} u_{i_m} \right)_{i_1 \dots i_{n-1} i_{n+1} \dots i_{m-1} i_{m+1} \dots i_N} \end{aligned}$$

for $n < m$ because the order of the tensor is changed:
After contracting in: $m \text{ \& } m-1$

Matrix case: $A \bar{\times}_1 v = v^T \cdot A, \quad A \bar{\times}_2 v = A \cdot v$

Properties

$$(1) \quad (A \otimes B)(C \otimes D) = (AC) \otimes (BD),$$

$$(2) \quad (A \otimes B)^{-T} = A^{-T} \otimes B^{-T}$$

$$(3) \quad A \bullet B \bullet C = (A \bullet B) \bullet C = A \bullet (B \bullet C),$$

(Khatri-Rao product: tensor product of j-th columns)

$$(4) \quad (A \bullet B)^T (A \bullet B) = (A^T A) * (B^T B),$$

$$(A \bullet B)^{-1} = ((A^T A) * (B^T B))^{-1} (A \bullet B)^T$$

Proofs (1):

$$\begin{aligned}
 (A \otimes B)(C \otimes D) &= \\
 &= \begin{pmatrix} a_{11}B & \cdots & a_{1n}B \\ \vdots & & \vdots \\ a_{m1}B & \cdots & a_{mn}B \end{pmatrix} \cdot \begin{pmatrix} c_{11}D & \cdots & c_{1k}D \\ \vdots & & \vdots \\ c_{n1}D & \cdots & c_{nk}D \end{pmatrix} = \\
 &= \begin{pmatrix} a_{11}c_{11}BD + \cdots + a_{1n}c_{n1}BD & \cdots \\ \vdots & \end{pmatrix} = \\
 &= \begin{pmatrix} (AC)_{11}BD & \cdots \\ \vdots & \end{pmatrix} = (AC) \otimes (BD),
 \end{aligned}$$

Proofs (2):

$$(A \otimes B)^{-T} = A^{-T} \otimes B^{-T}$$

$$(A \otimes B)(A^{-1} \otimes B^{-1}) = \left((AA^{-1}) \otimes (BB^{-1}) \right) = I \otimes I = I$$

$$\begin{aligned} (A \otimes B)^T &= \begin{pmatrix} a_{11}B & \cdots & a_{1n}B \\ \vdots & & \vdots \\ a_{m1}B & \cdots & a_{mn}B \end{pmatrix}^T = \\ &= \begin{pmatrix} a_{11}B^T & \cdots & a_{m1}B^T \\ \vdots & & \vdots \\ a_{1n}B^T & \cdots & a_{nm}B^T \end{pmatrix} = A^T \otimes B^T \end{aligned}$$

Proofs (3):

$$A \bullet B \bullet C = (A \bullet B) \bullet C = A \bullet (B \bullet C),$$

$$\begin{aligned} (A \bullet B) \bullet C &= (a_1 \otimes b_1 \quad \cdots \quad a_n \otimes b_n) \bullet C = \\ &= ((a_1 \otimes b_1) \otimes c_1 \quad \cdots \quad (a_n \otimes b_n) \otimes c_n) = \\ &= (a_1 \otimes b_1 \otimes c_1 \quad \cdots \quad a_n \otimes b_n \otimes c_n) = \\ &= A \bullet (B \bullet C), \end{aligned}$$

because $(A \otimes B) \otimes C = A \otimes (B \otimes C) = A \otimes B \otimes C$

Proofs (4):

$$(A \bullet B)^{-1} = ((A^T A) * (B^T B))^{-1} (A \bullet B)^T$$

$$((A^T A) * (B^T B)) = (A \bullet B)^T (A \bullet B)$$

$$\begin{aligned} ((A^T A) * (B^T B)) &= \left((a_i^T a_j)_{ij} * (b_i^T b_j)_{ij} \right) = \\ &= \left((a_i^T a_j)(b_i^T b_j) \right)_{ij} = \begin{pmatrix} (a_1^T a_1)(b_1^T b_1) & \cdots \\ \vdots & \end{pmatrix} = \\ &= \begin{pmatrix} (a_1^T \otimes b_1^T)(a_1 \otimes b_1) & \cdots \\ \vdots & \end{pmatrix} = \begin{pmatrix} a_1^T \otimes b_1^T \\ \vdots \\ a_n^T \otimes b_n^T \end{pmatrix} (a_1 \otimes b_1 \quad \cdots \quad a_n \otimes b_n) = \\ &= (a_1 \otimes b_1 \quad \cdots \quad a_n \otimes b_n)^T (a_1 \otimes b_1 \quad \cdots \quad a_n \otimes b_n) = (A \bullet B)^T (A \bullet B) \end{aligned}$$

n-Mode Products Tensor with Matrices

General relation between n-mode product, mode-n unfolding and Kronecker (tensor) product:

$$Y = A \times_1 U^{(1)} \times_2 U^{(2)} \dots \times_N U^{(N)} \Leftrightarrow$$

$$Y_{(n)} = U^{(n)} \cdot A_{(n)} \cdot \left(U^{(N)} \otimes \dots \otimes U^{(n+1)} \otimes U^{(n-1)} \otimes \dots \otimes U^{(1)} \right)^T$$

$$Y = A \times_1 U^{(1)} \times_2 U^{(2)} \dots \times_N U^{(N)} = \sum_{i_1, \dots, i_N} A_{i_1 \dots i_N} U_{j_1 i_1}^{(1)} \dots U_{j_N i_N}^{(N)} = B_{j_1 \dots j_N}$$

N=2:

$$Y = A \times_1 U^{(1)} \times_2 U^{(2)} = U^{(1)} A \left(U^{(2)} \right)^T$$

$$Y_{(1)} = \left(U^{(1)} A \left(U^{(2)} \right)^T \right)_{(1)} = U^{(1)} A_{(1)} \left(U^{(2)} \right)^T$$

$$Y_{(2)} = \left(U^{(1)} A \left(U^{(2)} \right)^T \right)_{(2)} = \left(U^{(1)} A \left(U^{(2)} \right)^T \right)^T =$$

$$= U^{(2)} A^T \left(U^{(1)} \right)^T = U^{(2)} A_{(2)} \left(U^{(1)} \right)^T$$

n-Mode Products Tensor with Matrices

$$\begin{aligned}
 Y_{(1)} &= \left(A \times_1 U^{(1)} \times_2 U^{(2)} \times_3 U^{(3)} \right)_{(1)} = \\
 &= \left(\sum_{i_1, i_2, i_3} A_{i_1 i_2 i_3} U_{j_1 i_1}^{(1)} U_{j_2 i_2}^{(2)} U_{j_3 i_3}^{(3)} \right)_{(1)} = \\
 &= \left(\sum_{i_1} U_{j_1 i_1}^{(1)} \left(\sum_{i_2 i_3} A_{i_1 i_2 i_3} U_{j_2 i_2}^{(2)} U_{j_3 i_3}^{(3)} \right) \right)_{(1)} = \\
 &= \left(\sum_{i_1} B_{i_1 j_2 j_3} U_{j_1 i_1}^{(1)} \right)_{(1)} = \left(B_{i_1 j_2 j_3} \times_1 U_{j_1 i_1}^{(1)} \right)_{(1)} = \\
 &= U^{(1)} \left(B_{i_1 j_2 j_3} \right)_{(1)} = U^{(1)} \left(\sum_{i_2 i_3} A_{i_1 i_2 i_3} U_{j_3 i_3}^{(3)} U_{j_2 i_2}^{(2)} \right)_{(1)} = \\
 &= U^{(1)} \sum_k A_{i_1 k} \left(U^{(3)} \otimes U^{(2)} \right)_{r, k} = U^{(1)} A_{(1)} \left(U^{(3)} \otimes U^{(2)} \right)^T
 \end{aligned}$$

$$k = \{i_2 i_3\}, r = \{j_2 j_3\}$$

Recapitulation

Tensors as multi-index object with contractions

Graphical notation

Different products: Tensor/Kronecker
Khatri Rao
Hadamard
n-mode product

Matricization = unfolding, vectorization

Rank of a tensor (3 leg case)

Rank-1 tensor:

$$(X_{ijk}) = (a \circ b \circ c)$$

3 dimensional

$$(X_{ijk}) = (a \otimes b \otimes c)$$

as vector

with vectors a, b, and c

$$X_{ijk} = a_i b_j c_k$$

Rank-R tensor for 3-leg case:

PARAFAC (parallel factors)

Candecomp (canonical decomposition)

Polyadic form

CP (CANDECOMP/PARAFAC)

$$(A_{ijk}) = (u_1 \circ v_1 \circ w_1) + (u_2 \circ v_2 \circ w_2) + (u_3 \circ v_3 \circ w_3) + \dots$$

$$A_{ijk} = \sum_{r=1}^R (u_{ri} v_{rj} w_{rk})$$

Tensor rank R of tensor (A_{ijk}) is the number of rank-1 terms that are necessary for representing A.

Rank representation

$$\begin{aligned}
 A &= \sum_{r=1}^R u_r \circ v_r \circ w_r = \\
 &= \sum_{r=1}^R \left(\sum_{i=1}^I u_{ir} e_i^{(1)} \circ \sum_{j=1}^J v_{jr} e_j^{(2)} \circ \sum_{k=1}^K w_{kr} e_k^{(3)} \right) = \\
 &= \sum_{i,j,k} \left(\sum_{r=1}^R u_{ir} v_{jr} w_{kr} \right) e_i^{(1)} \circ e_j^{(2)} \circ e_k^{(3)}
 \end{aligned}$$

With matrices U, V, and W we can write

$$A_{ijk} = \sum_{r=1}^R (u_{ir} v_{jr} w_{kr}) = \sum_{p,q,t} (u_{ip} v_{jq} w_{kt}) \delta_{p,q,t}$$

$$A = (U, V, W) \cdot I$$

with I the 3-way tensor with 1 on the main diagonal

U, V, W describe basis transformation with $A \approx I$

Notation

Let U , V , and W be the matrices built by the vectors u_r , v_r , and w_r . Then we can write

$$A_{(1)} = U(W \bullet V)^T,$$

$$A_{(2)} = V(W \bullet U)^T,$$

$$A_{(3)} = W(V \bullet U)^T.$$

Short notation:

$$A = [[U, V, W]] = \sum_{k=1}^R u_k \circ v_k \circ w_k$$

Or more general with factor λ :

$$A = [[\lambda; U, V, W]] = \sum_{k=1}^R \lambda_k u_k \circ v_k \circ w_k$$

Proof:

Two-leg tensor

$$(u \circ v)_{(1)} = u \cdot v^T = \begin{pmatrix} u_1 \\ \vdots \\ u_n \end{pmatrix} \cdot (v_1 \quad \cdots \quad v_m)$$

One 3-leg tensor:

$$(u \circ (v \circ w))_{(1)} = u \cdot (w \otimes v)^T = u \cdot (w \bullet v)^T$$

General 3-leg case:

$$\begin{aligned} \left(\sum_{r=1}^R u_r \circ v_r \circ w_r \right)_{(1)} &= \sum_{r=1}^R (u_r \circ (v_r \circ w_r))_{(1)} = \\ &= \sum_{r=1}^R u_r \cdot (w_r \bullet v_r)^T = \\ &= (u_1 \quad \cdots \quad u_R) \cdot (w_1 \bullet v_1 \quad \cdots \quad w_R \bullet v_R)^T = \\ &= U(W \bullet V)^T \end{aligned}$$

General N-way tensor

$$A = [[U^{(1)}, U^{(2)}, \dots, U^{(N)}]] = \sum_{k=1}^R u_{1,k} \circ u_{2,k} \circ \dots \circ u_{N,k}$$

$$A = [[\lambda; U^{(1)}, U^{(2)}, \dots, U^{(N)}]] = \sum_{k=1}^R \lambda_k u_{1,k} \circ u_{2,k} \circ \dots \circ u_{N,k}$$

Mode-n matrix formula:

$$A_{(n)} = U^{(n)} \Lambda \left(U^{(N)} \bullet \dots \bullet U^{(n+1)} \bullet U^{(n-1)} \bullet \dots \bullet U^{(1)} \right)^T$$

with $\Lambda = \text{diag}(\lambda)$

Proof:

3-leg tensor, proof like before:

$$\sum_r \lambda_r u_r \circ v_r \circ w_r = U \Lambda (W \bullet V)^T$$

In general:

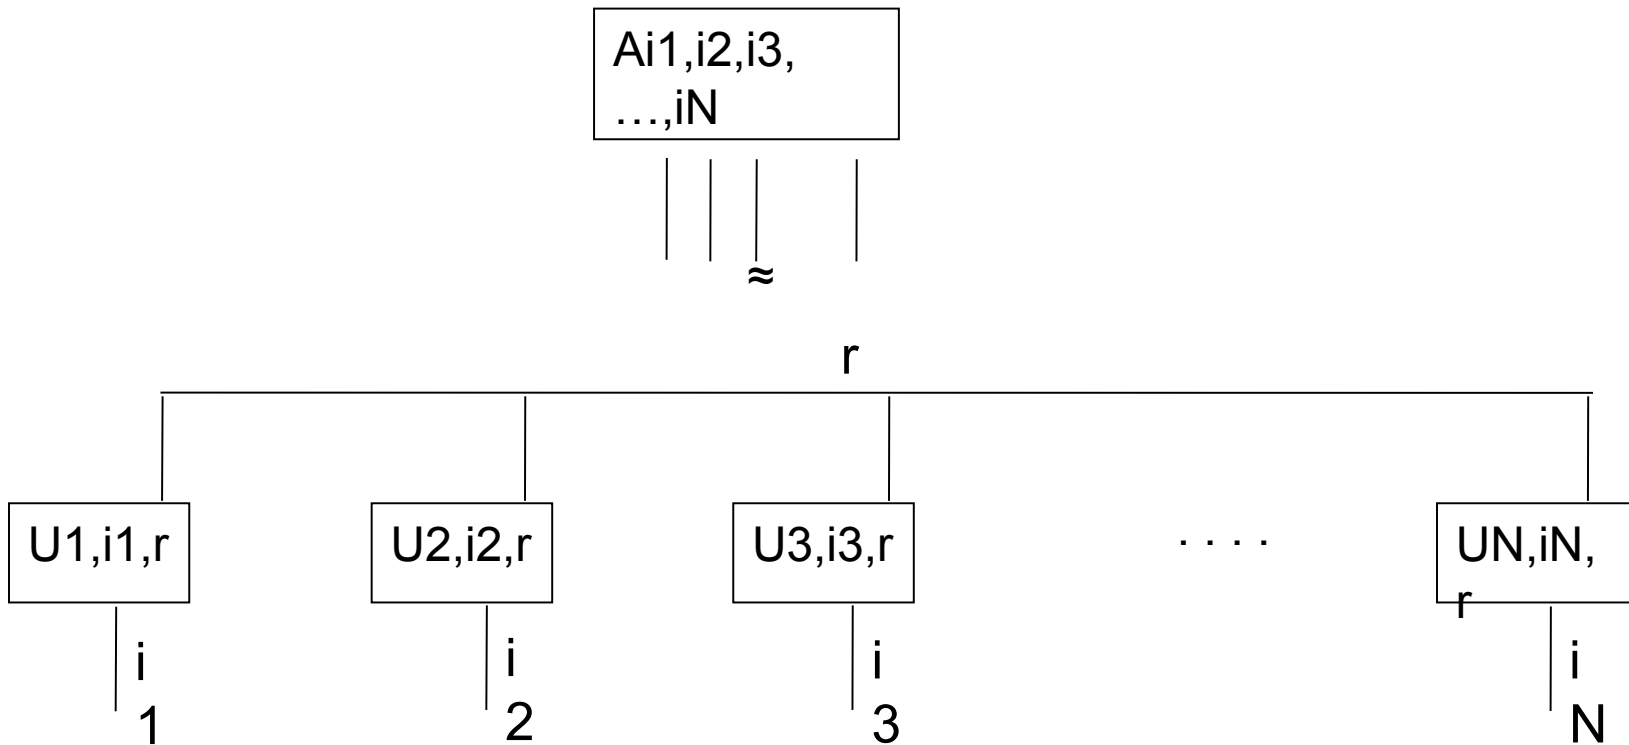

$$\begin{aligned} & U^{(1)} \Lambda \left(U^{(N)} \bullet \dots \bullet U^{(2)} \right)^T = \\ & = U^{(1)} \left(\lambda_1 U_1^{(N)} \otimes \dots \otimes U_1^{(2)} \quad \dots \quad \lambda_R U_R^{(N)} \otimes \dots \otimes U_R^{(2)} \right)^T = \\ & = \left(\sum_{r=1}^R \lambda_r U_r^{(1)} \otimes U_r^{(2)} \otimes \dots \otimes U_r^{(N)} \right)_{(1)} \end{aligned}$$

Low rank approximation

$$A_{i_1 \dots i_N} = \sum_{k=1}^R a_{ki_1} \dots a_{ki_N} \approx \sum_{k=1}^r b_{ki_1} \dots b_{ki_N}$$

- (1) For R large enough every A can be represented by CP
- (2) For given A there is a minimum R with this property
- (3) Approximate A as good as possible by $r < R$

PARAFAC Graphical

$$A_{i_1 \dots i_N} = \sum_{r=1}^M U_{1,i_1,r} \cdot U_{2,i_2,r} \cdot \dots \cdot U_{N,i_N,r}$$

$$A = \sum_{r=1}^M U_{1,r} \otimes U_{2,r} \otimes \dots \otimes U_{N,r}$$

Norm etc.

Inner product:

$$\langle A_{i_1 \dots i_N}, B_{i_1 \dots i_N} \rangle = \sum_{i_1 \dots i_N=1}^{n_1, \dots, n_N} A_{i_1 \dots i_N} B_{i_1 \dots i_N}$$

Norm:

$$\|A_{i_1 \dots i_N}\| = \sqrt{\sum_{i_1 \dots i_N=1}^{n_1, \dots, n_N} A_{i_1 \dots i_N}^2}$$

Rank-One tensor:

$$A = a^{(1)} \circ a^{(2)} \circ \dots \circ a^{(N)}$$

with vectors

$$A_{i_1 \dots i_N} = a_{i_1}^{(1)} \cdot a_{i_2}^{(2)} \cdot \dots \cdot a_{i_N}^{(N)}$$

$$a^{(j)}$$

Diagonal tensor:

$$A_{i_1 \dots i_N} \neq 0 \Leftrightarrow i_1 = i_2 = \dots = i_N$$

Inner Product

$$\sum_{i_1 \dots i_N} \sum_{r,s} A_{1i_1 r} B_{1i_1 s} \dots A_{Ni_N r} B_{Ni_N s} = \sum_{i_1 \dots i_N} \sum_r A_{1i_1 r} \dots A_{Ni_N r} \sum_s B_{1i_1 s} \dots B_{Ni_N s}$$

Symmetry

A tensor is called cubical, if every mode is of the same size,
 $n_1=n_2=\dots=n_N$

A cubical tensor is called supersymmetric, if its elements remain constant under any permutation of the indices:

$$A_{i_1 \dots i_N} = A_{i_{\pi(1)} \dots i_{\pi(N)}}$$

A tensor is partial symmetric, if it is symmetric in some modes, e.g. three-way tensor, where all frontal slices are symmetric matrices.

Example: Hypercube

$$A_{111} = 1, A_{112} = A_{121} = A_{211} = 2, A_{122} = A_{212} = A_{221} = 3, A_{222} = 4.$$

Results on tensor rank

$$A_{i_1 \dots i_N} = \sum_{k=1}^R a_{ki_1} \dots a_{ki_N} \quad \text{with minimum } R, \text{ dimension } n_1, \dots, n_N, n_j \leq n$$

For general N-way tensor it holds: $R = \text{rank} \leq nN - 1$

Proof: Assume $n_N = n = \max n_j$.

$$\begin{aligned} A &= \sum_{i_1, \dots, i_N} A_{i_1 \dots i_N} e_{i_1}^{(1)} \otimes \dots \otimes e_{i_N}^{(N)} = \\ &= \sum_{i_1, \dots, i_{N-1}} e_{i_1}^{(1)} \otimes \dots \otimes e_{i_{N-1}}^{(N-1)} \otimes \left(\sum_{i_N} A_{i_1 \dots i_N} e_{i_N}^{(N)} \right) \end{aligned}$$

where the summation runs over maximum rank 1 terms.

$$\prod_{j=1}^{N-1} n_j \leq n^{N-1}$$

Results on tensor rank

The true rank might be much smaller:

The maximum rank of a 3 leg tensor $3 \times 3 \times 3$ over IR is bounded by 5.

For general 3 leg $I \times J \times K$ tensor A the maximum rank is bounded by

$$\text{rank}(A) \leq \min\{IJ, IK, JK\}$$

For general 3 leg $I \times J \times 2$ tensor A the maximum rank is bounded by

$$\text{rank}(A) \leq \min\{I, J\} + \min\left\{I, J, \frac{\max\{I, J\}}{2}\right\}$$

The typical rank of a 3 leg tensor $5 \times 3 \times 3$ over IR is 5 or 6.

Results on tensor rank

Example:

$$A = a \otimes a + a \otimes b + b \otimes a + b \otimes b$$

with linearly independent a and b , $\text{rank} \leq 4$,
with 4 linearly independent terms, but

$$A = (a + b) \otimes (a + b) \quad \text{with rank 1.}$$

Theorem: $\text{rank}(A)=3$ for

$$A = v_1 \otimes v_2 \otimes w_3 + v_1 \otimes w_2 \otimes v_3 + w_1 \otimes v_2 \otimes v_3$$

with linearly independent v_j, w_j .

Proof: (1) $\text{rank}(A)=0 \Leftrightarrow A=0$

$$v_1 \otimes a = w_1 \otimes b$$

(2) $\text{rank}(A)=1$

$$u \otimes v \otimes w = v_1 \otimes v_2 \otimes w_3 + v_1 \otimes w_2 \otimes v_3 + w_1 \otimes v_2 \otimes v_3$$

Assume a linear functional with

$$\varphi_1(v_1) = 1, \quad \varphi := \varphi_1 \otimes id \otimes id$$

and apply it on above equation:

$$\begin{aligned} \varphi_1(u)v \otimes w &= v_2 \otimes w_3 + w_2 \otimes v_3 + \varphi_1(w_1)v_2 \otimes v_3 = \\ &= v_2 \otimes w_3 + (w_2 + \varphi_1(w_1)v_2) \otimes v_3 \end{aligned}$$

Left side rank 1, right side rank 2 !!!

(3) Rank(A)=2:

$$u \otimes v \otimes w + u' \otimes v' \otimes w' = v_1 \otimes v_2 \otimes w_3 + v_1 \otimes w_2 \otimes v_3 + w_1 \otimes v_2 \otimes v_3$$

If u and u' are linearly dependent there is a functional

$$\varphi_1(u) = \varphi_1(u') = 0, \quad \varphi_1(v_1) \neq 0 \quad \text{or} \quad \varphi_1(w_1) \neq 0$$

$$0 = (\varphi_1 \otimes id \otimes id)(A) = \varphi_1(v_1)(v_2 \otimes w_3 + w_2 \otimes v_3) + \varphi_1(w_1)v_2 \otimes v_3$$

←—————→
Linearly independent !!

Hence, u and u' have to be linearly independent, and one of the vectors u or u' must be linearly independent of v1, say u' is l.i. of v1.

Choose functional with

$$\varphi_1(v_1) = 1, \quad \varphi_1(u') = 0.$$

$$\varphi_1(u)v \otimes w = (v_2 \otimes w_3 + w_2 \otimes v_3) + \varphi_1(w_1)v_2 \otimes v_3$$

Again, the left-hand-side is rank ≤ 1 ,
the right-hand-side has rank 2 !!!

For a supersymmetric tensor we can define the symmetric rank:

$$\text{rank}_S(A) = \min \left\{ r : A = \sum_{k=1}^r a_r \circ a_r \circ \dots \circ a_r \right\}$$

Example: $A = (1,2)^{\otimes 3} = (1,2) \otimes \begin{pmatrix} 1 & 2 \\ 2 & 4 \end{pmatrix}$ $B = (1,1)^{\otimes 3} = (1,1) \otimes \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}$

Supersymmetric of symmetric rank 2.

Rank 1:?

$(a,b)^{\otimes 3} = A + B$, 4 equations for 2 unknowns a,b.

$$a^3 = 2, b^3 = 9, a^2b = 3, ab^2 = 5;$$

DOF: $R(I+J+K-2)$ Expected Rank:

$$|I + J + K - 2|$$

Examples

Strassen by considering a 3-leg tensor with rank 7
 Hackbusch page 69

$$\begin{pmatrix} a_1 & a_2 \\ a_3 & a_4 \end{pmatrix} \cdot \begin{pmatrix} b_1 & b_2 \\ b_3 & b_4 \end{pmatrix} = \begin{pmatrix} c_1 & c_2 \\ c_3 & c_4 \end{pmatrix} \quad \text{with submatrices } a_j, b_j, c_j$$

$$c_v = \sum_{\mu, \lambda=1}^4 t_{v, \mu, \lambda} a_\mu b_\lambda \quad \text{t is of rank 7.}$$

Minitask 4: Consider vector $x=(0,1,1,0)$. What is the hypercube-matrix representation and the rank. Can we permute x to generate a matrix of lower rank?

$$(0 \ 1 \ 1 \ 0) \rightarrow \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \quad (0 \ 0 \ 1 \ 1) \rightarrow \begin{pmatrix} 1 & 1 \\ 0 & 0 \end{pmatrix}$$

Matrix case: SVD

For a tensor that is a vector, the rank is 1.

For a tensor that is a $n \times m$ matrix, the rank is given by the singular value decomposition

$$A = U \Sigma V^T = \sum_{i=1}^r \sigma_i (u_i v_i^T) = \sum_{i=1}^r \sigma_i (u_i \otimes v_i)$$

r = the number of nonzero singular values.

SVD: For linear mapping $A: \mathbb{R}^n \rightarrow \mathbb{R}^m$ there exist basis transformations in \mathbb{R}^n and \mathbb{R}^m with orthogonal V and U such that in this basis the mapping is described by a diagonal matrix.
 r is the rank of A .

For low rank approximation we can delete small singular values σ .

Uniqueness of CP

Matrix case: A $n \times m$ matrix of rank r :

$$A = U_{n,r} V_{r,m}^T = \sum_{k=1}^r u_k \circ v_k$$

Every matrix factorization of this form gives a CP representation.

Also all QR-factorizations, SVD.

In the matrix case (2-leg-case) the rank representations are not unique!

Uniqueness 3 leg case

Let A be a three-way tensor of rank R :

$$A = [[U, V, W]] = \sum_{k=1}^R u_k \circ v_k \circ w_k$$

Uniqueness is related to other rank R representations upto scaling and upto permutations:

$$A = [[U, V, W]] = [[U\Pi, V\Pi, W\Pi]] \quad \text{for any } R \times R \text{ permutation } \Pi$$

$$A = \sum_{k=1}^R (\alpha_k u_k) \circ (\beta_k v_k) \circ (\gamma_k w_k) \quad \text{with } \alpha_k \beta_k \gamma_k = 1, \text{ for } k=1, \dots, R$$

k-rank of a matrix

The k-rank of a matrix A - denoted by k_A - is the maximum number k such that any k columns of A are linearly independent.

Minitask 5: Determine the k-rank of different matrices:

a) $\begin{pmatrix} 1 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 1 \\ 0 & 1 & 1 & 1 \end{pmatrix}$ b) $\begin{pmatrix} 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 0 & 1 \\ 0 & 1 & -1 & 0 \end{pmatrix}$ c) A regular?

Result on the rank: Let $T = [[A, B, C]]$

Then the CP representation of T is unique if

$$k_A + k_B + k_C \geq 2R + 2$$

T an $I \times J \times K$ -Tensor:

Then the CP representation of T is unique if

$$\min\{I, R\} + \min\{J, R\} + \min\{K, R\} \geq 2R + 2$$

For $R \leq K$ the CP representation of T is unique if

$$2R(R-1) \leq I(I-1)J(J-1)$$

The CP representation is unique for an N-way rank R tensor

$$A = [[A^{(1)}, A^{(2)}, \dots, A^{(N)}]] = \sum_{k=1}^R a_k^{(1)} \circ a_k^{(2)} \circ \dots \circ a_k^{(N)}$$

if

$$\sum_{n=1}^N k_{A^{(n)}} \geq 2R + (N-1)$$

Approximation of tensor by CP

Matrix case trivial via SVD: keep larger singular values and replace smaller one by 0.

For 3-way tensors this is not so easy. Especially for

$$A = \sum_{k=1}^R \lambda_k \mathbf{u}_k \circ \mathbf{v}_k \circ \mathbf{w}_k$$

summing up r of these terms will not give a good rank- r approximation.

For finding the best rank- r approximation we have to determine all factors simultaneously!

Rank-r approximation

The situation is even worse: the best rank-r approximation might even not exist!

Consider
$$A = u_1 \circ v_1 \circ w_2 + u_1 \circ v_2 \circ w_1 + u_2 \circ v_1 \circ w_1$$

where the matrices U, V, and W have linearly independent columns. Rank(A) = 3.

Approximation by rank-2 tensors:

$$B_\alpha = \alpha \left(u_1 + \frac{1}{\alpha} u_2 \right) \circ \left(v_1 + \frac{1}{\alpha} v_2 \right) \circ \left(w_1 + \frac{1}{\alpha} w_2 \right) - \alpha (u_1 \circ v_1 \circ w_1)$$

$$\|A - B_\alpha\| = \frac{1}{\alpha} \left\| u_2 \circ v_2 \circ w_1 + u_2 \circ v_1 \circ w_2 + u_1 \circ v_2 \circ w_2 + \frac{1}{\alpha} u_2 \circ v_2 \circ w_2 \right\| \xrightarrow{\alpha \rightarrow \infty} 0$$

Example for degeneracy!

Second example:

$$A(n) = n^2 \left(x + \frac{1}{n^2} y + \frac{1}{n} z \right)^{\otimes 3} + n^2 \left(x + \frac{1}{n^2} y - \frac{1}{n} z \right)^{\otimes 3} - 2n^2 x^{\otimes 3}$$

with linearly independent x, y, z .

The sequence of rank 3 tensors converges for $n \rightarrow \infty$ to the rank 6 tensor:

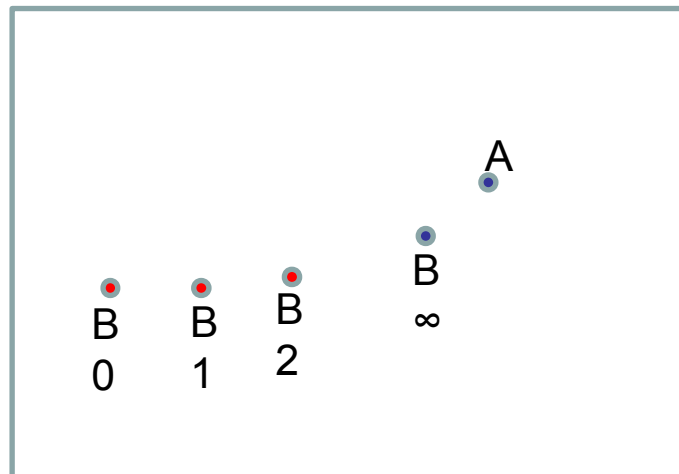

$$\frac{A(\infty)}{2} = x \otimes x \otimes y + x \otimes y \otimes x + y \otimes x \otimes x + x \otimes z \otimes z + z \otimes x \otimes z + z \otimes z \otimes x$$

Rank spaces

Hence a sequence of rank-2 tensors converges against a rank-3 tensor:

The space of rank-2 tensors is not closed!

We can approximate the 3-way tensor as good as we want by rank-2 tensors, but the sequence of approximations does not converge in the rank-2 space.

Computing the CP

Standard method: Alternating Least Squares method (ALS)

Given any (high-rank) tensor A
 Compute r-rank approximation in tensor B

$$\min_B \|A - B\| \quad \text{with} \quad B = \sum_{k=1}^r \lambda_k u_k \circ v_k \circ w_k = [[\lambda; U, V, W]]$$

ALS approach: fix two matrices, e.g. V and W, and solve for U.
 This leads to the matrix minimization

$$\min_{\hat{U}} \|A_{(1)} - \hat{U}(W \bullet V)^T\|_F$$

with solution

$$\hat{U} = A_{(1)} \left((W \bullet V)^T \right)^{-1} = A_{(1)} (W \bullet V) (W^T W * V^T V)^{-1}$$

Computing

Advantage: We only have to compute the pseudoinverse of small $r \times r$ -matrices

Afterwards, the factors λ_k are defined by normalization

$$\lambda_k = \|\hat{u}_k\|, \quad u_k = \hat{u}_k / \lambda_k, \quad k = 1, \dots, r$$

In this way we update U, then V, then W, then again U and so on until convergence.

Costs per step:

$$A_{(1)} \left(W \bullet V \right) \left(W^T W * V^T V \right)^{-1}$$

$n_1 \times (n_2 n_3)$ $(n_2 n_3) \times r$ $r \times n_3$ $n_3 \times r$ $r \times n_2$
 $n_2 \times r$

$$O(r^3 + n_1 n_2 n_3 r + n_3 r^2 + n_2 r^2)$$

ELS

ALS with enhanced line search

Assume, ALS has computed new U_{new} replacing U_{old} .
Hence, we have a change in the direction $\Delta = U_{new} - U_{old}$
in the form $U_{new} = U_{old} + \Delta$.

We generalize this by introducing line search and
step size μ in the form

$$U_{new} = U_{old} + \mu \Delta$$

looking for an optimal value of μ .

$$\begin{aligned} & \min_{\mu} \left\| A - \sum_{k=1}^R (u_k + \mu \delta_k) \circ v_k \circ w_k \right\|^2 \\ &= \min_{\mu} \left\| \left(A - \sum_{k=1}^R u_k \circ v_k \circ w_k \right) - \mu \sum_{k=1}^R \delta_k \circ v_k \circ w_k \right\|^2 \\ &= \min_{\mu} \| B - \mu C \|^2 \rightarrow \mu \rightarrow U_{new} = U_{old} + \mu \Delta \end{aligned}$$

ELS general

$U_{\text{new}} = U_{\text{old}} + \mu \Delta U$, $V_{\text{new}} = V_{\text{old}} + \mu \Delta V$, $W_{\text{new}} = W_{\text{old}} + \mu \Delta W$,

$$\begin{aligned} & \min_{\mu} \left\| A - \sum_{k=1}^R (u_k + \mu \delta_{u,k}) \circ (v_k + \mu \delta_{v,k}) \circ (w_k + \mu \delta_{w,k}) \right\|^2 \\ &= \min_{\mu} \left\| B - \mu^3 C - \mu^2 D - \mu E \right\|^2 \\ &= \min_{\mu} a_0 + a_1 \mu + a_2 \mu^2 + a_3 \mu^3 + a_4 \mu^4 + a_5 \mu^5 + a_6 \mu^6 \end{aligned}$$

Find the 5 roots of the derivative and choose the root with minimum value of the objective function.

Gives new U, V, and W.

Use ALS for new search directions and repeat.

Application of the CP

Starting point: 3-leg tensors often have small rank and the low-rank approximation is unique.

Therefore, the best approximating rank-1 term can give useful information on the data:

- Mixtures of analytes can be separated
- Concentrations can be measured
- Pure spectra and profiles can be estimated

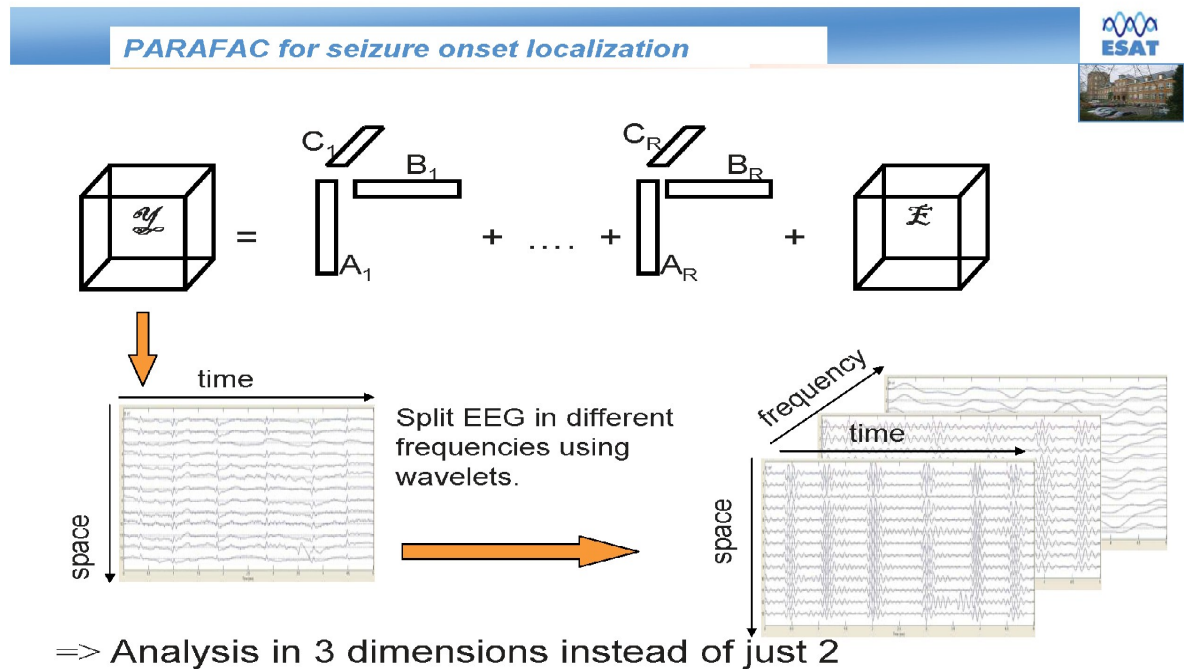

Typical example: 3-way data in time, space frequency

Translate matrix case by additional index in 3-leg tensor to achieve uniqueness!

Application of the CP

Van Huffel: PARAFAC in EEG monitoring

EEG data as 3-way tensor

EEG Monitoring

Interpretation of a trilinear component

PARAFAC: Example extracting 1 component

$$X = C_1 \cdot A_1 \cdot B_1$$

B_1 : time course

A_1 : distribution over channels

C_1 : frequency content (distribution across scales).

EEG rank terms

PARAFAC for seizure onset localization

EEG

More interesting seizure

A

B

C

11

Better localization by CP than visually or by other matrix techniques.

Block PARAFAC (L,L,1)

Consider more general higher rank terms (L,L,1)
Because larger blocks might be necessary for
accurate representation of the data.

$$T = \sum_{r=1}^R E_r \otimes c_r, \quad E_r : I \times J \text{ - matrix}, \quad \text{rank}(E_r) = L$$

$$T = \sum_{r=1}^R (A_r \cdot B_r^T) \otimes c_r$$

Also block representations are often unique, e.g.
for $RL \leq \min(I,J)$ and C without proportional columns.

„Essentially unique“, upto - permutations,
- factor between A and B
- scaling

Visualization

$$T = (A, B, c) \cdot D = [[D; A, B, c]] = \sum_{r=1}^R D_r \times_1 A_r \times_2 B_r \times_3 c_r$$

Uniqueness and applications

Mode n-Rank of a Tensor

View the tensor as collection of vectors in the n-th index (fibers)
 The rank of these collection of vectors is the mode n-rank.

Example with $R_1=R_2=2, R_3=1$

Mode $n=3$:

Vectors $(0,0), (1,1), (1,1), (0,0)$

$$R_3 = \text{rank} \begin{pmatrix} 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 \end{pmatrix} = 1$$

Mode n-rank is the rank of the mode-n unfolding matrix $A(n)$

Tucker Decomposition

- (three-mode) factor analysis (Tucker, 1966)
- N-mode PCA (principal component analysis)
- Higher-order SVD (HOSVD) (De Lathauwer, 2000)
- N-mode SVD

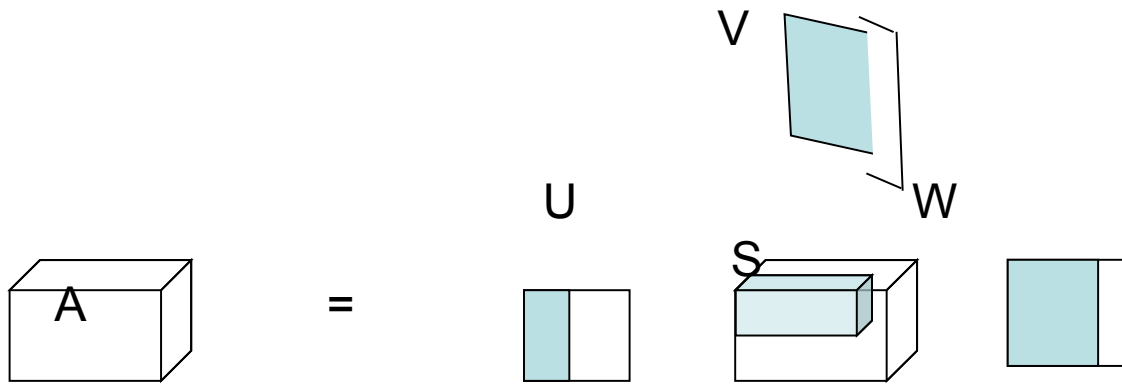

Idea: decompose given N-way tensor into a core
N-way tensor with less entries in each dimension
applying a SVD basis transformation in each mode.

$$\begin{aligned} A = S \times_1 U \times_2 V \times_3 W &= \sum_{p=1}^P \sum_{q=1}^Q \sum_{k=1}^K s_{pqk} \mathbf{u}_p \circ \mathbf{v}_q \circ \mathbf{w}_k = \\ &= [[S; U, V, W]] = (U, V, W) \cdot S \end{aligned}$$

With core tensor S and U, V, W matrices relative to each mode

Tucker Decomposition

Unfolding in i and $\{jk\}$,
 SVD of U
 Backfolding ΛV
 Repeat for other
 unfoldings.

$$(A_{ijk}) = (S_{ijk}) \times_1 U \times_2 V \times_3 W$$

$$(A_{ijk}) = \sum_{\mu_1=1}^{k_1} \sum_{\mu_2=1}^{k_2} \sum_{\mu_3=1}^{k_3} S_{\mu_1 \mu_2 \mu_3} \cdot u_{\mu_1}^{(i)} \circ v_{\mu_2}^{(j)} \circ w_{\mu_3}^{(k)}$$

$$A_{ijk} = \sum_{\mu_1}^{k_1} \sum_{\mu_2}^{k_2} \sum_{\mu_3}^{k_3} S_{\mu_1 \mu_2 \mu_3} u_{\mu_1 i} v_{\mu_2 j} w_{\mu_3 k}, \quad i = 1, \dots, I, \quad j = 1, \dots, J, \quad k = 1, \dots, K$$

Multilinear rank (k_1, k_2, k_3)

Computation

Compute SVDs of all matricifications:

$$A_{(1)} : I_1 \times I_2 I_3; \quad SVD : A_{(1)} = U^{(1)} \Sigma^{(1)} V^{(1)T}$$

$$A_{(2)} : I_2 \times I_1 I_3; \quad SVD : A_{(2)} = U^{(2)} \Sigma^{(2)} V^{(2)T}$$

$$A_{(3)} : I_3 \times I_1 I_2; \quad SVD : A_{(3)} = U^{(3)} \Sigma^{(3)} V^{(3)T}$$

Apply basis transformations relative to U-parts of SVDs:

$$S = A \times_1 U^{(1)T} \times_2 U^{(2)T} \times_3 U^{(3)T}$$

Gives new representation of A in terms of S and U's:

$$A = S \times_1 U^{(1)} \times_2 U^{(2)} \times_3 U^{(3)}$$

U with orthonormal columns.

S all-orthogonal and ordered.

Proof:

Reminder:

$$n \neq m : A \times_m U \times_n V = A \times_n V \times_m U$$

$$A \times_n U \times_n V = A \times_n (VU)$$

$$B = A \times_n U \Leftrightarrow B_{(n)} = U \cdot A_{(n)}$$

Define:

$$S := A \times_1 U^{(1)T} \times_2 U^{(2)T} \times_3 U^{(3)T}$$

Then it holds

$$\begin{aligned} A &= S \times_1 U^{(1)} \times_2 U^{(2)} \times_3 U^{(3)} = \\ &= \left(A \times_1 U^{(1)T} \times_2 U^{(2)T} \times_3 U^{(3)T} \right) \times_1 U^{(1)} \times_2 U^{(2)} \times_3 U^{(3)} = \\ &= A \times_1 \left(U^{(1)T} U^{(1)} \right) \times_2 \left(U^{(2)T} U^{(2)} \right) \times_3 \left(U^{(3)T} U^{(3)} \right) = \\ &= A \times_1 I \times_2 I \times_3 I = A \end{aligned}$$

Core Tensor S is all-orthogonal:

$$A = S \times_1 U^{(1)} \times_2 U^{(2)} \times_3 U^{(3)}$$

with the additional property

$$\langle S_{i,\dots}, S_{j,\dots} \rangle = 0 \quad \text{for } i \neq j$$

Proof: $S_{(1)} = U^{(1)} A_{(1)} (U^{(3)} \otimes U^{(2)})$ according to slide 34/35

$$S_{(1),i} = U_i^{(1)} A_{(1)} (U^{(3)} \otimes U^{(2)})$$

$$\langle S_{(1),i}, S_{(1),j} \rangle = (U^{(3)} \otimes U^{(2)})^T A_{(1)}^T (U_i^{(1)T} U_j^{(1)}) A_{(1)} (U^{(3)} \otimes U^{(2)})$$

and similarly for index 2 and 3.

Minitask 6

Compute Tucker decomposition.

Matricification and SVD:

$$\begin{pmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \begin{pmatrix} 1 & 1 & 1 & 1 \end{pmatrix}$$

All U 's are $\frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ 1 \end{pmatrix}$

$$S := A \times_1 U^{(1)T} \times_2 U^{(2)T} \times_3 U^{(3)T} = \sum_{ijk} 1 \cdot U_i U_j U_k = 2\sqrt{2}$$

$$A = S \times_1 U^{(1)} \times_2 U^{(2)} \times_3 U^{(3)} = (2\sqrt{2}) \cdot U \circ U \circ U = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \circ \begin{pmatrix} 1 \\ 1 \end{pmatrix} \circ \begin{pmatrix} 1 \\ 1 \end{pmatrix}$$

Properties

Mode-n singular values = norms of slices =
 = singular values of matricifications A_n
 Size of S is automatically reduced to mode-ranks!

Further reduction:

Truncate by deleting small singular values/vectors:

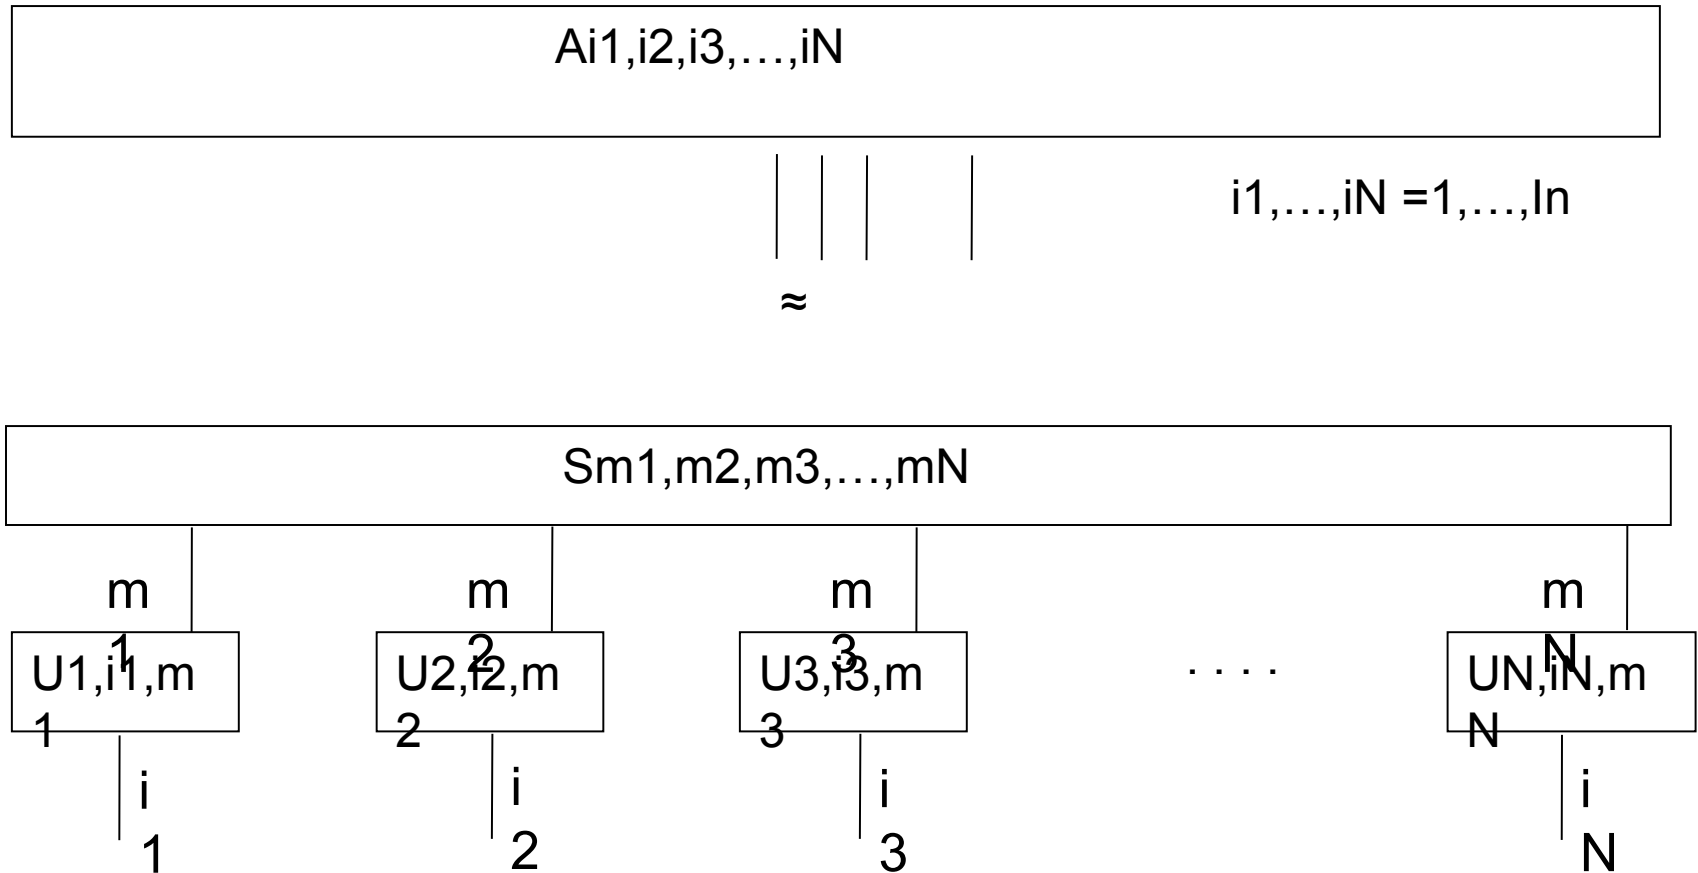

$$S = A \times_1 U^{(1)T} \times_2 U^{(2)T} \times_3 U^{(3)T} \rightarrow$$

$$\tilde{S} = A \times_1 \tilde{U}^{(1)T} \times_2 \tilde{U}^{(2)T} \times_3 \tilde{U}^{(3)T}$$

with \tilde{U} related to nonzero singular values.

$$A \rightarrow \tilde{A} = \tilde{S} \times_1 \tilde{U}^{(1)} \times_2 \tilde{U}^{(2)} \times_3 \tilde{U}^{(3)}$$

Tucker Graphical

$$A_{i_1 \dots i_N} = \sum_{m_1, \dots, m_N}^D S_{m_1, \dots, m_N} U_{1, m_1 i_1} \dots U_{N, m_N i_N},$$

Three-way Tucker

$$A = S \times_1 U \times_2 V \times_3 W = \sum_{p=1}^P \sum_{q=1}^Q \sum_{k=1}^K S_{pqk} u_p \circ v_q \circ w_k = [[S; U, V, W]]$$

$$A_{ijm} = \sum_{p=1}^P \sum_{q=1}^Q \sum_{k=1}^K S_{pqk} u_{ip} v_{jq} w_{mk},$$

Matricifications (according to slide 34/35):

$$A_{(1)} = U \cdot S_{(1)} (W \otimes V)^T$$

$$A_{(2)} = V \cdot S_{(2)} (W \otimes U)^T$$

$$A_{(3)} = W \cdot S_{(3)} (V \otimes U)^T$$

N-way Tucker

$$A = S \times_1 U^{(1)} \times_2 U^{(2)} \dots \times_N U^{(N)} = [[S; U^{(1)}, U^{(2)}, \dots, U^{(N)}]]$$

$$A_{i_1 i_2 \dots i_N} = \sum_{k_1=1}^{R_1} \sum_{k_2=1}^{R_2} \dots \sum_{k_N=1}^{R_N} S_{k_1 k_2 \dots k_N} u_{i_1 k_1}^{(1)} u_{i_2 k_2}^{(2)} \dots u_{i_N k_N}^{(N)}, \quad i_n = 1, \dots, I_n$$

$$A_{(n)} = U^{(n)} \cdot S_{(n)} \left(U^{(N)} \otimes \dots \otimes U^{(n+1)} \otimes U^{(n-1)} \otimes \dots \otimes U^{(1)} \right)^T$$

Additional definitions:

Tucker1 is decomposition relative to only one index,

Tucker2 relative to 2 indices, and

Tucker relative to all indices.

Computing the Tucker Dec.

For $n=1, \dots, N$

$U(n) :=$ matrix of left singular vectors of $A(n)$

Compute $S := A \times_1 U^{(1)T} \times_2 U^{(2)T} \times_3 \cdots \times_N U^{(N)T}$

Output: $S, U(1), \dots, U(N)$.

We can again use this algorithm also for approximating A by choosing in $U(n)$ only the dominant left singular vectors!

$R_n \otimes \dots \otimes R_n$

Approximating Tucker dec.

$$\min_{G, U^{(1)}, \dots, U^{(N)}} \left\| A - [[S; U^{(1)}, \dots, U^{(N)}]] \right\|$$

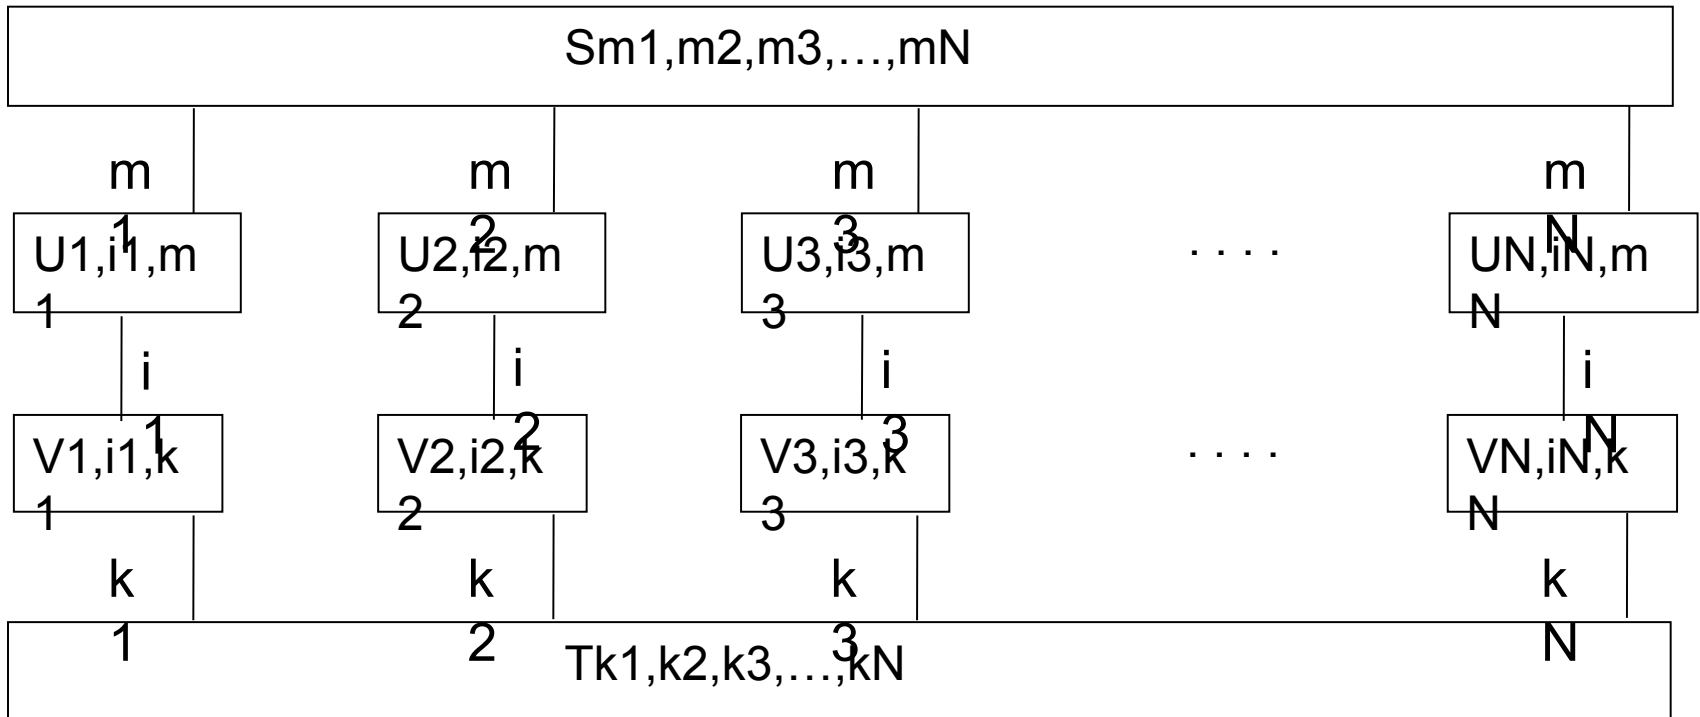

subject to $S \in \mathbb{R}^{r_1 \times \dots \times r_N}$, $U^{(n)} \in \mathbb{R}^{I_n \times r_n}$ columnwise orthogonal

Rewrite as minimizing
$$\left\| \text{vec}(A) - \left(U^{(N)} \otimes \dots \otimes U^{(1)} \right) \text{vec}(S) \right\|$$

with solution
$$S := A \times_1 U^{(1)T} \times_2 U^{(2)T} \times_3 \dots \times_N U^{(N)T}$$

$$\begin{aligned} & \left\| A - [[S; U^{(1)}, \dots, U^{(N)}]] \right\|^2 \\ &= \|A\|^2 - 2 \langle A, [[S; U^{(1)}, \dots, U^{(N)}]] \rangle + \left\| [[S; U^{(1)}, \dots, U^{(N)}]] \right\|^2 \\ &= \|A\|^2 - 2 \langle A \times_1 U^{(1)T} \times_2 \dots \times_N U^{(N)T}, S \rangle + \|S\|^2 \\ &= \|A\|^2 - 2 \langle S, S \rangle + \|S\|^2 = \|A\|^2 - \|S\|^2 \\ &= \|A\|^2 - \left\| A \times_1 U^{(1)T} \times_2 \dots \times_N U^{(N)T} \right\|^2 \end{aligned}$$

Inner Product

ALS for Tucker

$$\max_{U^{(n)}} \left\| A \times_1 U^{(1)T} \times_2 \cdots \times_N U^{(N)T} \right\|$$

subject to $U^{(n)} \in \mathbb{R}^{I_n \times r_n}$ columnwise orthogonal

$$\max_{U^{(n)}} \left\| U^{(n)T} W \right\| \text{ with } W = A_{(n)} \left(U^{(N)} \otimes \cdots \otimes U^{(n+1)} \otimes U^{(n-1)} \otimes \cdots \otimes U^{(1)} \right)$$

ALS method:

For $n=1, \dots, N$:

choose $U^{(n)}$ the r_n dominant singular vectors of W

Repeat until convergence

Uniqueness

Tucker is not unique:

$$[[S; A, B, C]] = [[S \times_1 U \times_2 V \times_3 W; AU^{-1}, BV^{-1}, CW^{-1}]]$$

$$\begin{aligned} & [[G \times_1 U \times_2 V \times_3 W; AU^{-1}, BV^{-1}, CW^{-1}]] = \\ & = (S \times_1 U \times_2 V \times_3 W) \times_1 AU^{-1} \times_2 BV^{-1} \times_3 W^{-1} = \\ & = S \times_1 (AU^{-1})U \times_2 (BV^{-1})V \times_3 (CW^{-1})W = \\ & = S \times_1 A \times_2 B \times_3 C = [[S; A, B, C]] \end{aligned}$$

according to slides 81 and 25/26.

Application: Tensorfaces

Given a database of images of different persons, e.g. with different looks(=expressions), illumination, positions(=views).

We can collect all the images in a big 5-leg tensor

$$A = \left(a_{i_{people}, i_{views}, i_{illum}, i_{express}, i_{pixel}} \right)$$

In the example there is a database of 28 male persons with 5 poses, 3 illuminations, 3 expressions, each image 512 x 352 pixels (compressed to 7943).

Hence, A is a $28 \times 5 \times 3 \times 3 \times 7943$ tensor.

Database

Principal Component Analysis

PCA

Use eigenfaces to capture the important features in a compact form. Often eigendecomposition and eigenvectors are used in PCA.

Here we use the Tucker decomposition:

$$A = Z \times_1 U_{people} \times_2 U_{views} \times_3 U_{illum} \times_4 U_{express} \times_5 U_{pixels}$$

resulting in

Interpretation

The mode matrix U_{pixels} can be interpreted as PCA.

By the core tensor Z we can transform the eigenimages present in U_{pixels} into eigenmodes representing the principal axes of variation across the various factors (people, viewpoints, illuminations, expressions) by forming

$$Z \times_5 U_{pixels}$$

Eigenfaces

The first 10 PCA eigenvectors (eigenfaces) contained in the mode matrix U_{pixels}
